Analytical study in the case of a Cantor set Experiment : cavity polaritons in a Fibonacci potential Summary

# Table of contents

- 2 Analytical study in the case of a Cantor set
- 3 Experiment : cavity polaritons in a Fibonacci potential

## 4 Summary

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

• • = • • = •

Study systems with a (spatial and/or spectral) fractal feature.

Motivation :

- Little is known about systems with singular continuous spectra (which includes fractal spectra)
- Ubiquity of such spectra (quasi-crystals, quasi-periodic potentials)
- Explain experimental and numerical observations

Objectives :

- Identify typical behaviour of relevant physical quantities in the presence of a fractal feature (spatial and/or spectral) → power-law modulated by log-periodic oscillations
- Derive analytical expressions

・ロト ・ 同ト ・ ヨト ・ ヨト ・

Analytical study in the case of a Cantor set Experiment : cavity polaritons in a Fibonacci potential Summary

Fractal :

- a set with a discrete scaling symmetry
- fractal dimension d<sub>f</sub> (length scale l; volume scales as l<sup>d</sup>f)

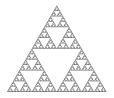

Figure: Sierpinski gasket

## ④ Summary

Quantum dynamics for a triadic Cantor set spectrum.

 $H = -\frac{d^2}{dx^2} + V(x)$  on  $L^2(\mathbb{R})$ , with associated triadic Cantor set spectrum.

Figure: Triadic Cantor set. Fractal dimension  $d_f = \frac{\ln 2}{\ln 3}$ 

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrum

Triadic Cantor set K : zero (Lebesgue) measure. Degenerate density of states  $\rho(\epsilon)$ . Define measure : $d\mu(\epsilon) \equiv \rho(\epsilon)d\epsilon$  :

Verifies :  $\int_{\mathcal{K}} f(x) d\mu(x) = \frac{1}{2} \int_{\mathcal{K}} f(\frac{x}{3}) d\mu(x) + \frac{1}{2} \int_{\mathcal{K}} f(\frac{x+2}{3}) d\mu(x)$ (scaling property)

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrum

イロト イポト イヨト イヨト

How does the fractal feature affect the dynamics of the wave packet  $|\psi(t)
angle$  ?

- RMS displacement  $\Delta x(t) = \sqrt{\int (x(t) x_0)^2 |\psi(x, t)|^2 dx}$
- 2 return probability  $p(t) = |\langle \psi(0) | \psi(t) \rangle|^2$

3 ...

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

・ 同 ト ・ ヨ ト ・ ヨ ト

Introduction Analytical study in the case of a Cantor set Experiment : cavity polaritons in a Fibonacci potentia Summary Other relevant quantities

A relevant quantity : the time-averaged return probability :

$$C(t)=rac{1}{t}\int_0^t|\langle\psi(0)|\psi(t')
angle|^2dt'$$

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

(日) (同) (三) (三)

A relevant quantity : the time-averaged return probability :

$$C(t) = \frac{1}{t} \int_0^t |\langle \psi(0) | \psi(t') \rangle|^2 dt' = \dots = \iint_{K \times K} \operatorname{sinc}((\epsilon' - \epsilon)t) d\mu(\epsilon) d\mu(\epsilon')$$

Note :  $\epsilon$  and t are coupled variables. Method

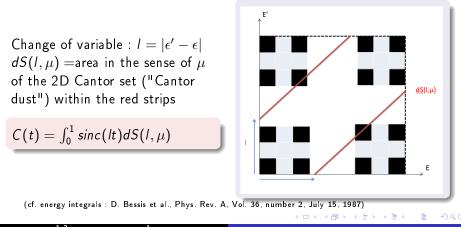

- use the scaling symmetry of the measure to obtain a functionnal equation
- 2 apply the Mellin transform

• • • • • • •

#### Introduction Analytical study in the case of a Cantor set

Experiment : cavity polaritons in a Fibonacci potential Summary Appropriate measure Time-averaged return probability Other relevant quantities

$$C(t) = \iint_{K \times K} \operatorname{sinc}((\epsilon' - \epsilon)t) d\mu(\epsilon) d\mu(\epsilon')$$

Appropriate measure Time-averaged return probability Other relevant quantities

イヨト イヨト イヨト

The main steps :

- **1** Mellin transform :  $\zeta(\alpha) = \int_0^1 l^{-\alpha} dS(l,\mu)$
- **2** scaling property :  $\zeta(\alpha) = \int_0^1 l^{-\alpha} dS(l,\mu) = \iint_{K \times K} \frac{d\mu(x)d\mu(y)}{|x-y|^{\alpha}} = \frac{3^{\alpha}}{2}\zeta(\alpha) + \epsilon(\alpha)$
- $(\alpha) = \frac{\epsilon(\alpha)}{1 \frac{3^{\alpha}}{2}}$
- ( inverse Mellin transform  $ightarrow dS(l,\mu) 
  ightarrow {\cal C}(t)$

Time-averaged return probability for triadic Cantor set

$$C(t) = \frac{t^{-\ln 2/\ln 3}}{\ln(3)} \sum_{n} \epsilon_{n} e^{-\frac{2i\pi n}{\ln(3)} \ln t} \sin\left(\frac{\pi}{2}(d_{n}-1)\right) \Gamma(d_{n}-1)$$

$$\begin{aligned} d_n &= \frac{|n(2)|}{|n(3)|} + \frac{2i\pi n}{|n(3)|}, \ \epsilon_n &= \int_{K \times K} \frac{d\mu(x)d\mu(y)}{|x-y+2|^{d+\frac{2i\pi n}{|n(3)}}}, \ \Gamma \ \text{the Euler gamma function} \\ &\Rightarrow C(t) &= t^{-\ln 2/\ln 3} G_p(\ln t/\ln 3), \ G_p(y+1) = G_p(y) \end{aligned}$$

power-law modulated by log-periodic oscillations.

<sup>●</sup> C(t) ∝ t<sup>d<sub>f</sub></sup>, with  $d_f = \frac{\ln 2}{\ln 3}$  (fractal dimension) for a triadic Cantor set.

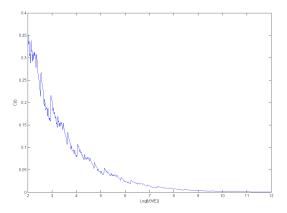

Figure: Return probability C(t) for a Cantor spectrum

Appropriate measure Time-averaged return probability Other relevant quantities

・ 同 ト ・ ヨ ト ・ ヨ ト

Partial summary :

- General method :
  - scaling property
  - $\rightarrow$  functionnal equation  $f(x) = \frac{1}{b}f(ax) + g(x)$
  - ightarrow Mellin transform

$$\to f(x) = x^{\ln(b)/\ln(a)} G_p\left(\frac{\ln x}{\ln a}\right)$$

- Typical behaviour due to a fractal spectrum : power-law modulated by log-periodic oscillations
- The method gives an intuition of which are the relevant physical quantities to observe typical behaviour

Other relevant quantities :

- Participation ratio :  $P_r(t) = \frac{1}{t} \int_0^t \frac{dt}{|\langle x|\psi(t')\rangle|^4}$
- RMS displacement :  $\Delta x(t) = \sqrt{\int (x(t) x_0)^2 |\psi(x, t)|^2 dx}$

• • = • • = •

(a) 10 µm

Figure:  $S_1 = B$ ,  $S_2 = A$ ,  $S_{j+1} = S_{j-1}S_j$ 

Figure: Fibonacci cavity Source 11000

Photon described by  $\psi(x, y, z)$ , confined in z direction :

$$E\psi(x,y) = -rac{\hbar^2}{2m_{ph}}\Delta_{\perp}\psi(x,y)$$

with  $\Delta_{\perp} = \partial_x^2 + \partial_y^2$ ,  $m_{ph}$  effective mass of the photon.

Mapping to a 1D problem with effective quasi-periodic potential V(x):

$$E\psi(x) = \frac{\hbar^2}{2m_{ph}} \left[ -\frac{d^2}{dx^2} + V(x) \right] \psi(x)$$

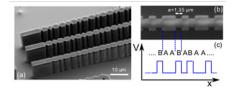

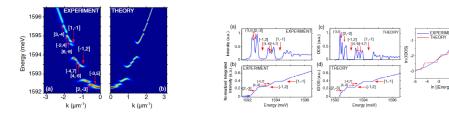

Figure: Fibonacci cavity

#### Numerical and experimental results

Akkerman, Gurevich et al., Physical Review Letters 112, 146404 (2014)

Integrated density of states (IDOS) :

$$N(\epsilon) = \int_{spectre} heta(\epsilon - \epsilon') d\mu(\epsilon')$$

Figure: IDOS for a triadic Cantor set spectrum

Time-averaged return probability :

$$C(t) = rac{1}{t} \int_0^t |\langle \psi(0)|\psi(t')
angle|^2 dt'$$

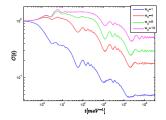

Figure: Time-averaged return probability of a wave packet in a Fibonacci potential. (E. Gurevich)

Log-periodic oscillation, signature of the fractal feature of the spectrum.

# 4 Summary

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

• • = • • =

In summary :

- We identified the signature of a fractal spectrum through measurable physical quantities : power-law modulated by log-periodic oscillation, for dynamical and spectral quantities (C(t), integrated density of states)
- Oscillations difficult to observe; easier with dynamical quantities
- Verified experimentally with polaritons in a Fibonacci potential (Cantor like spectrum)
- General method to study theoritically systems with a fractal feature
- applied to the return probability for a Cantor spectrum

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Next : other relevant quantities in quantum mechanics

- Signature of the fractal spectral feature in the Thouless coefficient
- Spatial correlation of the eigenfunction ; adaptation of Thouless formula :  $\overline{\phi(0,\epsilon)^*\phi(x,\epsilon)}\propto e^{-|x|\gamma(\epsilon)}$
- Spontaneous emission of a single atom coupled to a fractal continuum
- Superradiance of a two atoms system coupled to a fractal continuum
