Consider systems with a (spatial and/or spectral) fractal feature.

Motivation :

- singular continuous spectra are ubiquitous in physical systems, but not well known
- Explain experimental and numerical observations

Objectives :

- Identify typical behaviour of relevant physical quantities in the presence of a fractal feature (spatial and/or spectral)  $\rightarrow$  power-law modulated by log-periodic oscillations
- Derive analytical expressions, and relate them to experimental results

## ④ Summary

Quantum dynamics for a triadic Cantor set spectrum.

 $H = -\frac{d^2}{dx^2} + V(x)$  on  $L^2(\mathbb{R})$ , with associated triadic Cantor set spectrum.

Figure: Triadic Cantor set. Fractal dimension  $d_f = \frac{\ln 2}{\ln 3}$ 

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

イロト イポト イヨト イヨト

Triadic Cantor set K : zero (Lebesgue) measure. Degenerate density of states  $\rho(\epsilon)$ . Define measure : $d\mu(\epsilon) \equiv \rho(\epsilon)d\epsilon$  :

Verifies :  $\int_{K} f(x) d\mu(x) = \frac{1}{2} \int_{K} f(\frac{x}{3}) d\mu(x) + \frac{1}{2} \int_{K} f(\frac{x+2}{3}) d\mu(x)$ (scaling property)

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

マロト イヨト イヨト

How does the fractal feature affect the dynamics of the wave packet  $|\psi(t)
angle$  ?

- RMS displacement  $\Delta x(t) = \sqrt{\int (x(t) x_0)^2 |\psi(x, t)|^2 dx}$
- 2 return probability  $p(t) = |\langle \psi(0) | \psi(t) \rangle|^2$
- 3 ...

A relevant quantity : the time-averaged return probability :

$$C(t) = rac{1}{t}\int_0^t |\langle \psi(0)|\psi(t')
angle|^2 dt'$$

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrum

(日) (同) (三) (三)

A relevant quantity : the time-averaged return probability :

$$C(t) = \frac{1}{t} \int_0^t |\langle \psi(0) | \psi(t') \rangle|^2 dt' = \iint_{K \times K} \operatorname{sinc}((\epsilon' - \epsilon)t) d\mu(\epsilon) d\mu(\epsilon')$$

Note :  $\epsilon$  and t are coupled variables. Method

- use the scaling symmetry of the measure to obtain a functional equation
- 2 apply the Mellin transform

• • = • • = •

#### Introduction Analytical study in the case of a Cantor set

Experiment : cavity polaritons in a Fibonacci potential Summary Appropriate measure Time-averaged return probability Other relevant quantities

$$C(t) = \iint_{K imes K} sinc((\epsilon' - \epsilon)t) d\mu(\epsilon) d\mu(\epsilon')$$

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrum

Appropriate measure Time-averaged return probability Other relevant quantities

The main steps :

- **9** Mellin transform :  $\zeta(\alpha) = \int_0^1 I^{-\alpha} dS(I,\mu) = \iint_{K \times K} \frac{d\mu(x)d\mu(y)}{|x-y|^{\alpha}}$
- Scaling property :  $\int_{K \times K} \frac{d\mu(x)d\mu(y)}{|x-y|^{\alpha}} = \frac{1}{2} \iint_{K \times K} \frac{d\mu(x)d\mu(y)}{3^{-\alpha}|x-y|^{\alpha}} + \underbrace{\frac{1}{2} \iint_{K \times K} \frac{d\mu(x)d\mu(y)}{3^{-\alpha}|x-y+2|^{\alpha}}}_{g(\alpha)}$

$$=\frac{3^{\alpha}}{2}\zeta(\alpha)+g(\alpha)$$

- - Mellin transform of  $f: M_f(s) = \int_0^\infty f(x) x^{s-1} dx$
  - Inverse Mellin transform :  $M_{\phi}^{-1}(x) = rac{1}{2i\pi}\int_{c-i\infty}^{c+i\infty}\phi(s)x^{-s}ds$

Appropriate measure Time-averaged return probability Other relevant quantities

Time-averaged return probability for triadic Cantor set

$$C(t) = \frac{t^{-\ln 2/\ln 3}}{\ln(3)} \sum_{n} \epsilon_n e^{-\frac{2i\pi n}{\ln(3)}\ln t} \sin\left(\frac{\pi}{2}(d_n - 1)\right) \Gamma(d_n - 1)$$

$$\begin{aligned} d_n &= \frac{\ln(2)}{\ln(3)} + \frac{2i\pi n}{\ln(3)}, \ \epsilon_n = \int_{K \times K} \frac{d\mu(x)d\mu(y)}{|x-y+2|^{d+\frac{2i\pi n}{\ln(3)}}}, \ \Gamma \ \text{the Euler gamma function} \\ \Rightarrow C(t) &= t^{-\ln 2/\ln 3} G_p(\ln t/\ln 3), \ G_p(y+1) = G_p(y) \end{aligned}$$

power-law modulated by log-periodic oscillations.

<sup>●</sup> C(t) ∝ t<sup>-d<sub>f</sub></sup>, with d<sub>f</sub> =  $\frac{\ln 2}{\ln 3}$  (fractal dimension) for a triadic Cantor set.

・ 同 ト ・ ヨ ト ・ ヨ ト

Partial summary :

• General method :

scaling property

- $\rightarrow$  functional equation  $f(x) = \frac{1}{b}f(ax) + g(x)$
- $\rightarrow$  Mellin transform

$$ightarrow f(x) = x^{\ln(b)/\ln(a)} G_{
ho}\left(rac{\ln x}{\ln a}
ight), \ G_{
ho}(y+1) = G_{
ho}(y)$$

- Typical behaviour due to a fractal spectrum : power-law modulated by log-periodic oscillations
- The method gives an intuition of which are the relevant physical quantities to observe typical behaviour

Other relevant quantities :

- Participation ratio :  $P_r(t) = \frac{1}{t} \int_0^t \frac{dt}{|\langle x|\psi(t')\rangle|^4}$
- RMS displacement :  $\Delta x(t) = \sqrt{\int (x(t) x_0)^2 |\psi(x, t)|^2 dx}$

## 4 Summary

Ariane SORET<sup>1,2</sup> Evgeni GUREVICH<sup>1</sup>, Eric AKKERMAN Quantum dynamics of a wave packet for a Cantor spectrur

・ 同 ト ・ ヨ ト ・ ヨ

In summary :

- We identified the signature of a fractal spectrum through measurable physical quantities : power-law modulated by log-periodic oscillation, for dynamical and spectral quantities (C(t), integrated density of states)
- General method to study theoretically systems with a fractal feature
- Oscillations difficult to observe ; easier with dynamical quantities
- Verified experimentally with polaritons in a Fibonacci potential (Cantor like spectrum)

・ 同 ト ・ ヨ ト ・ ヨ ト

Next : other relevant quantities in quantum mechanics

- Signature of the fractal spectral feature in the Thouless coefficient  $\gamma(\epsilon)$
- Spatial correlation of the eigenfunction; generalization of Thouless formula :  $\overline{\phi(0,\epsilon)^*\phi(x,\epsilon)} \propto e^{-|x|\gamma(\epsilon)}$
- Spontaneous emission of a single atom coupled to a fractal spectrum
- Superradiance of a two atoms system coupled to a fractal spectrum
